

Aim: Validate the open-webui response with with below entities:

- 1) PII(Personal Identification Information)
- 2) Toxic Language
- 3) Profanity Language

here response LLM response should not expose above entities in response.

Tried techniques :

1. Guardrails AI- Here issue I am facing is the guard LLM taking more processing time to validate the response. Till it is showing nothing in the UI. Also it is exposing guardrails server to validate the response here we dont want to user external server for privacy purpose.

Also here not getting where to integrate this Guardrails LLM as currently open-webui using stream response and it required whole response once to validate. See if we can use guardrails in open-webui's llm itself so it will reduce latency too.

2. Prompt integration: I have used prompt rules also to detect PII and mask it while answering. But it is not consistent and efficient.

3. LLM-Guard-3(llama-guard3:1b): Here we are passing query and prompt content to LLM and it has 13 taxonomy to determine the

content or query is safe or unsafe, accordingly
it will giving output as below
if the content is safe the it is giving as: safe
if the content is unsafe then it is giving as
unsafe along with category like: unsafe S1
